

Instagram Fitness Channel Analytics & Growth Report

A data-led review of reach, paid dependence, content contribution, audience composition, profile conversion and the next 90-day growth plan.

REPORTING WINDOW

30 days

23 Jun - 22 Jul 2026

TOTAL VIEWS

429,413

82.5% from ads

ACCOUNTS REACHED

241,391

Down 58% period-on-period

Strong awareness, weak organic depth and conversion

VIEWS

429,413

82.5% paid / promoted

ACCOUNTS REACHED

241,391

58% below prior period

PROFILE VISITS

2,161

21.9% below prior period

LINK TAPS

15

40% below prior period

OVERALL PERFORMANCE ASSESSMENT

5.8 /10

Large paid-led exposure and excellent non-follower distribution, but current momentum and downstream actions are materially weaker than the prior period.

Primary business risk

82.5% of views came from ads. Only about 75,147 views were non-ad views, so headline scale is not yet evidence of a self-sustaining organic content engine.

Primary growth opportunity

96.7% of views came from non-followers. Discovery is not the main constraint; the priority is turning exposure into profile visits, follows and a clear next action.

What the data says

- **Reach fell sharply:** 241,391 accounts reached, down 58%. The implied previous-period reach was approximately 574,740.
- **Recent content is highly concentrated:** the 26 Jun reel produced 26K views - around 7.9x the second-ranked visible reel in the 30-day list.
- **Reels still dominate,** but their contribution slipped from 84.6% over 90 days to 79.6% in the latest 30 days.
- **The audience is sharply defined:** 94.1% men, 86.9% aged 18-34 and 96.9% located in India.
- **Profile conversion is low:** only 0.90% of reached accounts visited the profile; 0.69% of profile visitors tapped the external link.
- **Link intent is deteriorating:** 90-day external taps fell 65.5%, much faster than profile visits (-8.4%).

Data source: screenshots supplied by the channel owner. Previous-period absolute values are estimated from Instagram's displayed percentage changes and rounded. Engagement, follower growth, watch time, retention, ad spend and cost metrics were not supplied.

429K views, but the scale is predominantly purchased

ESTIMATED AD VIEWS

354,266

82.5% of all views

ESTIMATED ORGANIC VIEWS

75,147

17.5% of all views

NON-FOLLOWER VIEWS

415,242

96.7% of views

VIEWS PER REACHED ACCOUNT

1.78x

Average repeat exposure

View source mix

Paid / ads: 82.5%

Organic: 17.5%

Audience source mix

Non-followers: 96.7%

Followers: 3.3%

Paid scale must be judged with cost data

Without ad spend, CPM, cost per profile visit, cost per follower and campaign objective, it is not possible to conclude whether the 354K estimated ad views were efficient.

Non-follower discovery is excellent

Approximately 415,242 views came from non-followers. This indicates broad top-of-funnel exposure, although paid delivery may account for a large share of it.

Interpretation

The channel is currently operating more like an awareness campaign than a compounding creator account. The next reporting cycle should split every major KPI into **organic** and **paid** performance. A reel should earn organic proof first, then receive paid support only if it beats the channel's retention, saves, shares, profile-visit and follow benchmarks.

One recent breakout is carrying an otherwise weak top-

Content format contribution

Top visible content - last 30 days

Format shift

Format	30 days	90 days	Change
Reels	79.6%	84.6%	-5.0 pp
Stories	15.1%	11.7%	+3.4 pp
Posts	5.4%	3.8%	+1.6 pp

Percentages may total slightly above 100% because Instagram rounds each category.

Winner concentration

- The visible top four reels total about 34.3K views.
- The leading 26 Jun reel contributes roughly 75.8% of those visible top-four views.
- The #1 reel is approximately 7.9x the #2 reel, indicating limited breadth of recent winners.
- Product-looking content appears weaker than everyday/personal or incident-led visuals in the visible thumbnails. Validate this against topic-level data.

Content direction

Prioritise repeatable series built around relatable gym experiences, personal stories, practical tests, food/protein situations and surprising fitness observations. Product-led content should earn attention through a problem or story before presenting the product.

A concentrated young, male and India-first fitness audience

Gender composition

Core persona

Indian men aged 18-34 represent the clearest audience centre. Content can be direct, energetic, practical and culturally familiar.

Geographic reach

India accounts for 96.9%. The top four cities total only 12.6%, suggesting the audience is geographically dispersed rather than concentrated in one metro.

Strategic choice

If women are an intended growth segment, the current 5.9% share is a major gap. If the brand is deliberately male-focused, positioning should become more explicit and consistent.

Exposure is not translating into meaningful action

30-day conversion funnel

0.90%

Reached accounts that visited the profile

0.69%

Profile visitors that tapped the link

0.0062%

Reached accounts that tapped the link

30-day period comparison

Metric	Current	Previous est.	Change
Accounts reached	241,391	574,740	-58.0%
Profile activity	2,176	2,790	-22.0%
Profile visits	2,161	2,767	-21.9%
External link taps	15	25	-40.0%

30-day momentum vs prior period

Conversion bottleneck

At the current rate, roughly one link tap is generated for every 16,093 reached accounts. The channel needs a clearer profile promise, stronger pinned content and a single, compelling call to action.

The broader quarter confirms a link-intent problem

PROFILE ACTIVITY

10,449

9.4% below preceding 90 days

PROFILE VISITS

10,382

8.4% below preceding 90 days

EXTERNAL LINK TAPS

67

65.5% below preceding 90 days

90-DAY LINK CONVERSION

0.65%

Prior estimated: 1.71%

Top visible content - last 90 days

90-day profile outcomes vs preceding period

Quarter-level insight

- The visible 90-day winners are more balanced than the recent 30-day set: 37K, 26K, 17K and 12K.
- Profile visits declined only 8.4%, but link taps fell 65.5%.
- The implied link-tap rate dropped from about 1.71% to 0.65% - a relative deterioration of roughly 62%.
- The latest 30-day profile visits are about 47% below the monthly average of the first 60 days in this 90-day window.

Likely causes to test

- Bio or external offer may be unclear, outdated or not relevant to the reels attracting traffic.
- Paid campaigns may optimise for views rather than high-intent actions.
- Content topics may create curiosity without a logical reason to visit or click.
- Too many destinations or weak landing-page continuity can suppress taps.

What to preserve, repair and stop

Area	Finding	Recommended decision
Discovery	96.7% non-follower views	PRESERVE: continue broad discovery hooks and shareable fitness situations.
Paid media	82.5% of views from ads	REPAIR: report spend and outcomes separately; boost only organic winners.
Organic engine	Only ~17.5% non-ad views	REPAIR: improve retention, repeatable series and posting consistency.
Content breadth	One reel dominates recent winners	REPAIR: create 3-4 recurring formats so success is not dependent on isolated breakouts.
Audience fit	Young Indian male audience	PRESERVE: use specific problems, language and references relevant to this segment.
Profile conversion	0.90% visit rate from reach	REPAIR: align reel CTA, bio promise, pinned posts and highlights.
External intent	15 taps in 30 days; 67 in 90 days	REPAIR URGENTLY: one destination, one offer, one reason to click.
Vanity metrics	Large view total obscures weak outcomes	STOP: evaluating performance primarily through total views.

Recommended content pillars

- **Relatable gym incidents:** mistakes, awkward situations, unexpected lessons.
- **Practical fitness tests:** strength, mobility, posture, daily capability.
- **Food and protein reality:** affordable Indian meals, myths, quantities, mistakes.
- **Personal journey and opinions:** choices, failures, discipline and progress.

Recommended publishing mix

- 4-5 Reels per week with at least two recurring series.
- Daily Stories that build context, proof, polls and follow-up conversations.
- One saveable carousel per week for structured education.
- One collaboration or response-format Reel every two weeks.

Creative rule

Every reel should have one job: earn a follow, trigger a save/share, or move the viewer to a specific next step. Avoid vague “follow for more” endings when a concrete promise can be used.

Turn paid awareness into a measurable creator growth

DAYS 1-30

Fix the foundation

Measurement and conversion reset

- Create a weekly sheet separating organic views, paid views, reach, follows, profile visits, link taps, saves, shares and watch-time metrics.
- Rewrite the bio around one audience and one result. Use one primary external destination.
- Pin three reels: who this page is for, strongest proof/story, and highest-value educational reel.
- Publish 16-20 reels using four content pillars. Test two hook styles per pillar.
- Do not boost a reel until it has at least 24 hours of organic data.

DAYS 31-60

Build repeatability

Series, retention and community

- Keep the top two recurring series; discontinue formats that consistently miss the median.
- Review retention at 1 second, 3 seconds, halfway and completion. Re-edit weak openings.
- Use Stories to continue each reel: poll, behind-the-scenes, answer, testimonial or next episode.
- Run collaboration posts with trainers, gyms, athletes or food creators serving the same audience.
- Retarget video viewers and profile visitors rather than buying only broad views.

DAYS 61-90

Scale winners

Systemise production and paid amplification

- Build a repeatable monthly calendar from proven hooks, topics and structures.
- Create a content library: hooks, B-roll, results, gym incidents, FAQs and audience objections.
- Use paid budget primarily on reels that already outperform organic benchmarks.
- Create a simple conversion asset only if it matches the audience promise.
- Produce a full quarterly report comparing channel growth, organic efficiency and conversion.

Suggested 90-day KPI targets

KPI	Current baseline	90-day directional target
Organic share of views	17.5%	30-35% or higher
Profile visits / reach	0.90%	1.2-1.5%
Link taps / profile visits	0.69%	1.2%+ with one clear offer
Recent top-content breadth	One dominant winner	At least 3 reels above 10K organic views per 30 days
Paid reporting	Views only	Spend, CPM, CPV, profile visits, follows and cost per result

Data needed for a complete professional performance a

Channel-level metrics

- Total followers at start and end of period
- Follows and unfollows by day
- Accounts engaged and content interactions
- Saves, shares, comments and likes
- Audience active days and hours
- Organic vs paid reach and impressions
- Ad spend, campaign objective and audience

Reel-level metrics

- Views and reach
- Total and average watch time
- Retention graph and completion rate
- Likes, comments, saves and shares
- Profile activity and follows attributed
- Traffic source
- Boosted status and spend by reel

Why these fields matter

Views explain distribution, but retention explains creative quality; saves and shares explain usefulness; follows and profile visits explain audience fit; spend and cost metrics explain business efficiency.

Recommended monthly report structure

Section	Core question	Primary KPIs
Executive summary	Did the channel improve?	Organic reach, follower growth, engagement, conversion
Content analysis	Which topics and formats won?	Retention, shares, saves, follows per reel
Audience analysis	Who is watching and returning?	Age, gender, location, follower/non-follower mix
Paid performance	Was spend efficient?	CPM, CPV, cost per profile visit, cost per follow
Action plan	What changes next month?	Tests, targets, owners and deadlines

Limitations of this report: no engagement totals, follower changes, retention curves, watch time, posting count, exact content topics, paid spend or campaign goals were available. Recommendations are therefore based on distribution, audience and profile-action data only.
